Methanol poisoning at a glance
- with no means of analytical equipment available

Methanol is not toxic itself, but it is metabolized to the highly toxic formic acid/formate (see fig). The treatment is focused on blocking the enzyme (ADH) with either ethanol or fomepizole, buffer the metabolic acidosis with bicarbonate, and if possible use dialysis to remove methanol, formate and correct the metabolic acidosis.

Folinic acid may also be given to enhance the endogenous metabolism of formate.

All of the above should be initiated as early as possible, but any of these treatments are important – Use what you have available!

Diagnosis:
- **History**: Intake of illegal/bootleg alcohol, others in the environment with confirmed or suspect methanol poisoning (seriously ill, fatalities, blindness etc.)
- **Symptoms**: Hyperventilation (respiration (RF) > 20-25/min)/dyspnoea, visual disturbances (all kinds of), GI-symptoms, chest pain, “hangover”.

Treatment:
- Give **antidote** (ethanol orally or intravenously – dosing: See opposite side) **without delay**
  - Give **bicarbonate** (NaHCO₃) as soon as possible intravenously.
    - **500 mmol/L**: Give 250-500 mL or more within 1-2 hours until hyperventilation is corrected (RF < 20 /min).
    - **167 mmol/L**: Give 1000-1500 mL or more within 1-2 hours until hyperventilation is corrected (RF < 20 /min).
  - If only oral treatment is available: Tablets of 500 mg bicarbonate (= 6 mmol), 6-10 tablets every hour until hyperventilation is corrected (RF < 20 /min).
  - **Folinic acid** (or folic acid) 50mg iv. or orally (e.g. 10 tablets of 5mg) every 6 hours for 24-48 hrs.
  - If **intubation** is necessary: The patient must be hyperventilated (RF > 25/min) (until transferred to a unit with ICU)

Criterion for treatment when methanol poisoning is suspected (clinical findings only):
A. Asymptomatic patients: Observe.
B. Hyperventilation, no visual disturbances. Adequate blood pressure/pulse: Give ethanol and bicarbonate. Observe minimum 24 hours
C. Hyperventilation, visual disturbances, conscious: Give ethanol, bicarbonate, consider transport to dialysis facilities, folic acid
D. Hyperventilating, unconscious: Give ethanol, bicarbonate, transport to dialysis facilities, folic acid
E. Normoventilating/slow breath, unconscious: Likely poor prognosis if methanol poisoning. Be careful with ethanol in case this is a ethanol intoxication instead unless confident of methanol poisoning. Give bicarbonate, folic acid, and consider transport to referral hospital if possible

Transfer for advanced treatment such as dialysis and/or ventilator support is often relevant

Prognostic aspects
Coma on admission and lack of hyperventilation indicates poor prognosis if the patient is suffering from methanol poisoning, but pure ethanol intoxication or a combination of those may be a differential diagnosis
When to call for assistance:
If there are patients with a strong suspicion of methanol poisoning, call the local referral hospital or office of Medecins sans Frontieres (MSF/Doctors without Borders - 072 8602590 or 072 8970614) for advice and to discuss possibilities for intervention.
One of the most important reasons for this is the possibility to identify toxic alcohol in the environment, start early treatment AND be able to warn the public about the possible danger.

Where there is one there is usually many

Suggested dosing regimen for ethanol (be aware of individual differences and frequent under-dosing):

<table>
<thead>
<tr>
<th></th>
<th>5% ethanol</th>
<th>10% ethanol</th>
<th>20% ethanol</th>
<th>40% ethanol</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Loading dose</strong></td>
<td>15mL/kg</td>
<td>7.5mL/kg</td>
<td>4mL/kg</td>
<td>2mL/kg</td>
</tr>
<tr>
<td><strong>Drinking dose/hour</strong></td>
<td>2mL/kg/hr</td>
<td>1mL/kg/hr</td>
<td>0.5mL/kg/hr</td>
<td>0.25mL/kg/hr</td>
</tr>
<tr>
<td>(not regular drinker)</td>
<td></td>
<td></td>
<td></td>

Rule of thumb: Beer contains 5%, wine 12-14% and spirits 40-45% ethanol.
